Information Technology

Practical Assessment Task (PAT)

2008

Guidelines to the teacher

1 Introduction

The objective of the PAT is to allow the teacher to directly and systematically observe and evaluate applied competence of the learner. The PAT comprises the application of the knowledge, skills and values particular to Information Technology.

In Information Technology the PAT counts 25% of the total promotion/ certification mark for the subject (i.e. 100 marks out of 400 marks). It is implemented across the first three terms of the school year and should be undertaken as one extended task, which is broken down into different phases or a series of smaller activities.

The IT PAT comprises of two components:

- Research project
- Software development (programming) project

Project	Scenario	Out of:	Converted to:
Research	The Mobile World	40	20
Programming	School Event	200	80
		Total:	100

A Research Project

1. What is the research project about?

The research project of the Practical Assessment Task in Information Technology requires the learner to conduct and demonstrate in-depth research within the context of a given scenario. The learner is required to generate a report on his/her research/findings on a chosen topic within the context of the given scenario.

2. Planning for the project

2.1 Description

The project specification is open-ended, i.e. the learner may choose his/her own computerrelated topic within the context of the given scenario.

Scenario

The Mobile World

One and a half billion people, all over the world, are walking around with powerful "computers" in their pockets and purses. The fact is that they often do not realize it, because these "computers" are often referred to by another device name. One such device could be today's high-end cell phones which have the computing power of a mid-1990s personal computer (PC). Marc Prensky, Innovate, June/July 2005

The learner is required to identify a topic to be researched from the above scenario.

The following are steps that may be followed during the research:

- Define the topic:
 - The learner has to describe what he/she plans to do in his/her research
- Identify how and where the information will be accessed.
 - Information must be extracted from a variety of sources.
- Use the information:

Clearly describe the different aspects of the topic. (Any material taken directly from websites or books must be acknowledged and placed in quotes.)

Draw a conclusion:

Finish up the project by drawing some conclusions related to the research that was undertaken.

In completing the task the learner will present his/her research in the form of a report.

(Also see Annexure 1 in Learning Programme Guidelines as well as Annexure 1 in Subject Assessment Guidelines)

2.2 Requirements for the research project

The learner will present the report in the form of a document compiled using a word processor. The document (\pm 8 pages) must contain the following:

- Title page
- Table of contents
- Introduction clearly stating what the topic is about
- Body discussing the topic, using clear headings and sub-headings supported by graphics, data, etc.
- Conclusion
- Bibliography Acknowledge all the sources used including television programmes, Internet sources, individuals, etc. The bibliography must be presented in alphabetical order of authors.
- Certificate of authenticity A certificate signed by the learner and countersigned by the teacher to verify that the project is the learner's own work.

3. Instructions to the learners

See Learner Section of this document.

4. Resources

The learner will need the following resources to be able to complete the above project:

- Access to a computer with the necessary software.
- Access to the Internet and a search engine such as Google
- Access to electronic reference material such as Encarta
- Any other sources that will help the learner to find relevant information.

5. Assessment of the research project

See Assessment Tool Section for the assessment sheet.

The assessment tool as well as the instruction sheet for the research project must be supplied to the learners.

6. Recording and Reporting

- The project should be completed under **controlled conditions** in the classroom and facilitated and monitored by the teacher. Collecting of information could be done at home.
- Each teacher will determine the **deadline** for handing in the final product, taking into account the final date on which projects must be submitted for external moderation.
- After the final product is submitted, a mark out of 40 will be allocated and thereafter converted to a mark out of 20.

7. Guidelines for managing the research project

It is recommended that the learners complete the research project by the end of the first term. There are two ways to go about managing the research project:

Option 1:

 You could dedicate one or two periods per week for the research task, while continuing with teaching during the remainder of the periods to complete the Grade 12 curriculum.

If you choose this option, you will need approximately 8 - 10 weeks to complete the research project.

Option 2:

• You could choose to dedicate a continuous period of time to the research task i.e. either the first two weeks of the term or the last two weeks of the term.

It is suggested that you record the name and topic of each learner at the beginning of this process, to avoid "instant projects" that might pop up and could possibly not be the learner's own work.

8. Hints for the research project

You can discuss the following example topic with learners to guide the learners in deciding which topic or focus area pertaining to the scenario they would like to address.

Example Topic – Mobile Learning

Defining the topic

Mobile learning, sometimes called m-learning, is learning accomplished with the use of small, portable computing devices. These computing devices may include: smartphones, personal digital assistants (PDAs) and similar handheld devices. There is some debate on the inclusion of tablet and laptop computers. Often, wireless two-way Internet connection is assumed as an integral component of mobile learning.

Possible focus areas that one can address:

- Discuss the devices in the context of mobile learning
- Benefits and challenges of using these devices
- Possible future trends

B Programming Project

1. What is the programming project about?

The programming project of the Practical Assessment Task in Information Technology requires the learner to develop a software solution for a particular problem within a given scenario.

2. Planning for the programming project

2.1 Description

Scenario for the 2008 Grade 12 PAT:

The school management team has approached the Grade 12 IT learners to develop a software solution to administer school-based events. The learners are requested to write a program in Java / Delphi that interacts with a database program and uses a GUI to interact with the user to solve the problem. In addition to the program, the learners also need to compile a technical manual and a user guide for the program.

The programming project is open-ended, i.e. the learner may choose his/her own topic or focus area within the context of the given scenario.

Examples of possible school-based events to choose from:

- A Grade 8 variety concert
- An athletics competition for Grade 8 learners to identify potential athletes
- o RCL (Representative Council of Learners) elections
- Field trips
- Competitions e.g. LAN parties
- Soccer round robin, etc.

In completing the project the learner will apply the following skills

- Analysis and design
- Software development
 - Programming skills using the programming language studied
 - Database development
 - o Graphical User Interface (GUI) design

2.2 Development phases of the project

The programming project will be completed in 3 phases indicated in the following table.

Phase	Marks	%
Phase 1: Analysis and Design	35	17.5
Phase 2: Coding and Implementation	115	57.5
Phase 3: Documentation and general evaluation	50	25

Documentation/evidence of what the learner did during each phase of development must be submitted at specified intervals.

Deadlines for handing in the final product of each phase will be set by the teacher. The product of each phase will be assessed and the marks will be recorded.

(Also see Annexure 1 in Learning Programme Guidelines as well as Annexure 1 in Subject Assessment Guidelines)

2.3 **Requirements for the project**

The learner needs to adhere to the following, minimum criteria:

Analysis and Design

- Description of the problem in his/her own words outlining the main aspects in one paragraph.
- Analysis of the problem What are the requirements and what should the programming solution provide?
- Design a solution how will the program / system meet the requirements? Provide a broad outline of the programming solution to the problem.

(See Learner section 2, Phase 1, and Assessment tool Phase 1)

Coding and Implementation

- The project must include the major development tools, i.e. database design and programming in an integrated manner. (Other applications could be integrated with these development tools)
- Other aspects of the programming project that will be assessed include:
 - Programming style
 - Graphical User Interface (GUI)
 - Use of Human-Computer Interaction (HCI) principles
 - Expertise required and functionality of the program
 - o Robustness of the program including the use of defensive programming techniques
 - Whether the project matches its original aims and goals

(See Learner section 2 Phase 2, Assessment tool Phase 2)

Documentation and general evaluation

- Document the solution, installation procedures and hardware and software • requirements - Technical Manual
- Compile a user guide
- Evaluate the following:
 - 0 Time management of the learner – Did he/she meet all the deadlines?
 - Appropriateness of the solution in the context of the scenario. 0

(See Learner section 2 Phase 3, Assessment tool Phase 3)

3. Instructions to the learners

See Learner section of this document.

4. Resources

The learner will need the following resources to be able to complete the project:

- Access to a computer with the following programs:
 - Programming language: Java or Delphi
 - Word processor such as MS Word
 - Database software such as MS Access
- IDE (for Delphi it is part of the programming language but for Java you will need additional software such as JBuilder / Turbo JBuilder or Netbeans)

NSC

5. Assessment of the PAT

The task should be completed under controlled conditions in the classroom and facilitated and monitored by the teacher.

See Assessment Tool Section for the assessment sheets for the different phases.

The assessment tool as well as the instruction sheet for the each phase must be supplied to learners.

Learners should be allowed to reflect on the marks they have obtained and address mistakes they have made before completing the next phase.

Learners will be required to demonstrate their system for debriefing at the end of phase 3. Teachers can use this opportunity to evaluate and assess parts of the project.

Guidelines for the demonstration and internal evaluation of the project:

- The teacher must schedule dates and times for demonstrations. Allow at least 20 minutes per project for the demonstration as well as about 10 minutes for setting up the project and brief feedback from the teacher.
- The learner should hand in all the documentation before the demonstration takes place at least one week in advance. The teacher should evaluate the documentation before the demonstration takes place.
- The demonstration must be done electronically on the computer.
- The learner must execute his/her computer program and show all the features of the program to the teacher for evaluation.
- The teacher can use test strategy provided in the technical manual as a guideline and ask the learner to perform parts of or all the test strategy.
- The teacher can require of the learner to execute other additional test procedures to make sure that the entire program is working correctly.
- The teacher can use the mark sheet for Phase 2 as a guideline and allocate marks accordingly during the demonstration.
- The teacher must identify random pieces of programming code (excluding the 10 % borrowed code) in the project. The learner must then explain the purpose and working of the randomly selected code to the teacher. This is done to ensure that learners did the coding themselves. A similar type of procedure will be followed during the external moderation. If the learner cannot explain the code used in the project, no marks can be awarded to the learner for the project.
- The learner must hand in the electronic copy of the project that was demonstrated. The teacher will use this copy to allocate any outstanding marks in order to finalise the mark.

NOTE: Once the product of a phase has been handed in and assessed that phase will not be re-assessed.

6. Recording and Reporting

The teacher will assess the phase, record the mark and give feedback to the learner

The marks for the different phases are added and converted to a mark out of 80 which will be the final mark.

7. Guidelines for managing the PAT

There are two ways to go about managing the programming project:

Option 1:

 Dedicate one or two periods per week to the programming project while simultaneously continuing with teaching to complete the Grade 12 curriculum during the rest of the week. If you choose this option, you will need approximately 14 - 16 weeks to complete the programming project

Option 2:

• You could choose complete most of the Grade 12 curriculum and then to dedicate a continuous period of time to the programming project

It is suggested that you "register" the learners' topics (events) when they start with phase one to avoid "instant projects" that might occur and could possibly not be the learner's own work.

Information Technology

Practical Assessment Task (PAT)

2008

Instructions to the learner

Practical Assessment Task (PAT) in Information Technology

The IT PAT comprises of two components:

- Research project
- Software development (programming) project

Project	Scenario	Out of:	Converted to:
Research	The Mobile world	40	20
Programming	School events	200	80
		Total:	100

A Research Project

1. What is the research project?

The research project of the Practical Assessment Task in Information Technology requires you the learner to conduct and demonstrate in-depth research on a chosen topic from a given scenario. You are required to generate a report on your research / findings within the context of the given scenario.

2. Planning for the research project

2.1 Scenario – The Mobile World

One and a half billion people, all over the world, are walking around with powerful "computers" in their pockets and purses. The fact is that they often do not realize it, because these "computers" are often referred to by another device name. One such device could be today's high-end cell phones which have the computing power of a mid-1990s personal computer (PC). Marc Prensky, Innovate, June/July 2005

You are required to identify a computer-related topic to be researched from the above scenario.

The following are steps that may be followed:

- Define the task
 - Describe what you plan to do in your research
- Identify how and where the information will be accessed.

Information must be extracted from a variety of sources.

• Use the information

Clearly describe the different aspects of the topic. (Any material taken directly from websites or books must be acknowledged and placed in quotes.)

Draw a conclusion

Conclude by drawing some conclusions related to the research that was undertaken.

In completing the project you will present your research in the form of a report.

You will present the report in the form of a document done on a word processor. The document (± 8 pages) must contain the following:

- Title page
- Table of contents
- Introduction clearly stating what the topic is about
- Body discussing the topic, using clear headings and sub-headings supported by graphics, data, etc.
- Conclusion
- Bibliography Acknowledge the all the sources used including television programmes, Internet sources, individuals, etc. The bibliography must be presented in alphabetical order of authors.
- Certificate of authenticity A certificate signed by the learner and countersigned by the teacher to verify that the project is the learner's own work.

2.2 What you will need to complete the project

You will need the following resources to be able to complete the above task:

- Access to a computer with the following the necessary software.
- Access to the Internet and a search engine such as Google
- Access to electronic reference material such as Encarta
- Any other sources that will help you to find relevant information.

2.3 Time management

The project must be completed under **controlled conditions** in the classroom and facilitated and monitored by the teacher. Collecting of information could be done at home.

The teacher will determine the **deadline** for handing in the final product.

B Programming Project

1. Planning for the programming project

1.1 Description

Scenario for the 2008 Grade 12 PAT:

The school management team has approached the Grade 12 IT learners to develop a software solution to administer such events. The learners are requested to write a program in Java / Delphi that interacts with a database program and uses a GUI to interact with the user to solve the problem. In addition to the program, the learners also need to develop a technical manual and a user guide for the program.

The programming project is open-ended, i.e. you may choose your own topic or focus area within the context of the given scenario.

Examples of possible school-based events to choose from:

- o A Grade 8 variety concert
- An athletics competition for Grade 8 learners to identify potential athletes
- o RCL (Representative Council of Learners) elections
- o Field trips
- o Competitions e.g. LAN parties
- Soccer round robin, etc.

In completing the project you will apply the following skills

- Analysis and design
- Software development
 - Programming skills using the programming language studied
 - Database development
 - Graphical User Interface (GUI) design

1.2 Development phases of the project

The programming project will be completed in 3 phases indicated in the following table:

Phase	Marks	%
Phase 1: Analysis and Design	35	17.5
Phase 2: Coding and Implementation	115	57.5
Phase 3: Documentation and general evaluation	50	25

Documentation / evidence of what you did during each phase of development must be submitted at specified intervals.

Dates for submitting the documentation / evidence will be set by the teacher.

Study the assessment tools beforehand to make sure that you have addressed all the relevant requirements according to the assessment tools.

Consider the feedback from the teacher indicated on the assessment tools and improve your work for the next phase accordingly.

1.3 Resources required for the project

You will need the following resources to be able to complete the project:

- Access to a computer with the following programs:
 - Programming language: Java or Delphi
 - Word processing such as Word
 - Database software such as Access
- IDE (for Delphi it is part of the programming language but for Java you will need additional software such as JBuilder/Turbo JBuilder or Netbeans)

1.4 Requirements for the project

The project must be completed under **controlled conditions** in the classroom and facilitated and monitored by the teacher.

You need to adhere to the following, minimum criteria:

Analysis and Design

- Description of the problem in your own words outlining the main aspects in one paragraph.
- Analysis of the problem What are the requirements and what should the programming solution provide?
- Design a solution how will the program / system meet the requirements? Provide a broad outline of the programming solution to the problem.

(See the following section Phase 1 and the Assessment tool Phase 1)

Coding and Implementation

- The project must include the major development tools, i.e. database design and programming in an integrated manner. (Other applications could be integrated with these development tools)
- Other aspects of the programming project that will be assessed include:
 - o Programming style
 - Graphical User Interface (GUI)
 - Use of Human-Computer Interaction (HCI) principles
 - Level of expert programming
 - Functionality of the program
 - $\circ\,$ Robustness of the program including the use of defensive programming techniques
 - \circ $\;$ Whether the project matches its original aims and goals

(See the following section Phase 2 and the Assessment tool Phase 2)

Documentation and general evaluation

- Printout of source code including comments, installation procedures and hardware and software requirements – Technical Manual
- Compile a user guide
- Demonstration of final product and debriefing by the teacher.
- The teacher will evaluate the following
 - Your time management Did you meet all the deadlines?
 - \circ $\;$ Appropriateness of the solution in the context of the scenario.

(See the following section Phase 3 and the Assessment tool Phase 3)

Due date:

2. Instructions for the phases of the programming project

The instructions for the different phases are as follows:

PHASE 1: Analysis & Design

In completing this phase you need to determine what the program / system should do and provide:

- 1. Problem Statement
 - Describe / Explain in your own words the problem to be solved
 - Give a possible / intended brief solution for the problem in your own words.
- 2. Obtain requirements for the program
 - Conduct discussions with end-users, make notes, gather documents and draw conclusions from these
 - Observe how the system currently works if possible, make notes.
 - Make notes on inputs, processing and output that will be required.
- 3. Convert requirements into specifications

Give a broad overview of the solution in terms of:

- Inputs
- Processing
- Outputs

Note: Include the following in your overview

- Defensive programming techniques such as:
 - o Data validation
 - o Error messages
 - Exception handling
- Data structures to organise and store data
 - o Database design
 - Data types, files, arrays, classes and objects etc.
- Graphical User Interface (GUI) design
- 4. Submit a document with the following:
 - Description of the problem
 - Evidence of methods used to gather information
 - Program specifications (As listed above)
 - Broad overview of solution to the problem

PHASE 2: Coding & Implementation Due date:

In completing this phase you will have to code the solution including the GUI as planned in the previous phase, create the data structures, debug and test the program. **Study the assessment tool for Phase 2 to make sure that your project meet the requirments.**

Suggested steps to follow to complete this phase:

- 1. Break up the broad solution as outlined in phase 1 into modules
- 2. Code / Create the GUI
- 3. Create the data structures to organise and store data.
- 4. Coding Code the solution according to requirements and specifications (inputs, processing and outputs) compiled in the first fase.
- 5. Testing / Debugging Ensure that the program runs correctly and is error free
 - Apply a **test strategy** to ensure that the program / system does what it should by using different ranges of data including extreme / erroneous test data.
- 6. Evaluate your program / system Does the program do what it should / meet the requirements? Did you apply good programming principles?
 - Review program code. Has good programming principles been applied? Study the assessment tool for phase 2 intensively.
 - Does the program / system work properly?
 - Well-designed GUI?

Note: You are allowed to make use of borrowed code but it cannot exceed more than 10% of your programming code. This will typically be code to perform exceptional / unusual functions such as playing a video clip etc. Your program will not be accepted by the teacher if the borrowed code exceeds the limit of 10%.

PHASE 3: Documentation & Evaluation Due date:

In completing this phase, you will have to finalise the documentation pertaining to the solution:

1. Technical Documentation

The technical documentation / manual must include the following:

- General description the problem and broad solution to the problem as compiled in phase 1
- Database design. Screenshots of the design view of the fields and their data types of the different tables as well as the relationships between the tables or a description thereof.
- Printouts of the code for the unusual system functions used for example use of system clock / CD player.
- Specifications of test procedures and test results.
- Sample runs of the program with results: A printout of the results showing that typical data has been used. The program must also be tested with extreme or erroneous data.
- Full printed listing of source code of all modules

2. User Guide

The user guide should include the following:

- Title sheet and table of contents.
- Background to the project. Here the history of the development of the project should be described.
- How to use the software detail depends on the complexity of the software and the user-friendliness of the interface and help functions.
- Scope and limitations of the program
- Hardware required to run the program (hard drive space, memory, CPU, special input devices, etc.)
- Software required in addition to the program itself, for example proprietary classes, operating system, etc
- Installation instructions.
- Files that are used and their contents. The format/layout of each file must be included.
- Detailed instructions for the user and a walk-through of the program.
- Input required. The exact format of the input should be specified, particularly if formatted input is being used, for example a date.
- Output / reports produced.
- Troubleshooting for potential problems
- Future developments. Given more resources, e.g. time and software, what additional features could be implemented?
- References and acknowledgements, especially where third party software were used.

3. Hand in:

- Electronic copy of programme and all applicable files e.g. data files, etc.
- Technical Manual
- User Guide

4. Demonstrate the program for evaluation and debriefing.

Guidelines for the demonstration of the project:

- The teacher will schedule dates and times for demonstrations about 20 minutes per project will be allowed.
- The learner should hand in all the documentation before the demonstration takes place at least one week in advance.
- The demonstration must be done electronically on the computer.
- The learner must execute his/her computer program and show all the features of the program to the teacher for evaluation.
- The teacher can use test strategy provided in the technical manual as a guideline and ask the learner to perform parts of or all the test strategy.
- The teacher can require of the learner to execute other additional test procedures to make sure that the entire program is working correctly.
- The teacher can use the mark sheet for Phase 2 as a guideline and allocate marks accordingly during the demonstration.
- As part of the demonstration, the teacher must identify random pieces of programming code (excluding the 10 % borrowed code) in the project. The learner must then be able to explain the purpose and working of the randomly selected code to the teacher. This is done to ensure that learners did the coding themselves. A similar type of procedure will be followed during the external moderation. If the learner cannot explain the code used in the project, no marks can be awarded to the learner for the project.
- The learner must hand in the electronic copy of the project that was demonstrated. The teacher will use this copy to allocate any outstanding marks in order to finalise the mark.

5. Final general evaluation

The teacher will evaluate the following:

- Time management did you meet all the deadlines?
- Utility value Is your solution appropriate in the context of the given scenario?
